

Edit Profile page

1. Change Photo Button

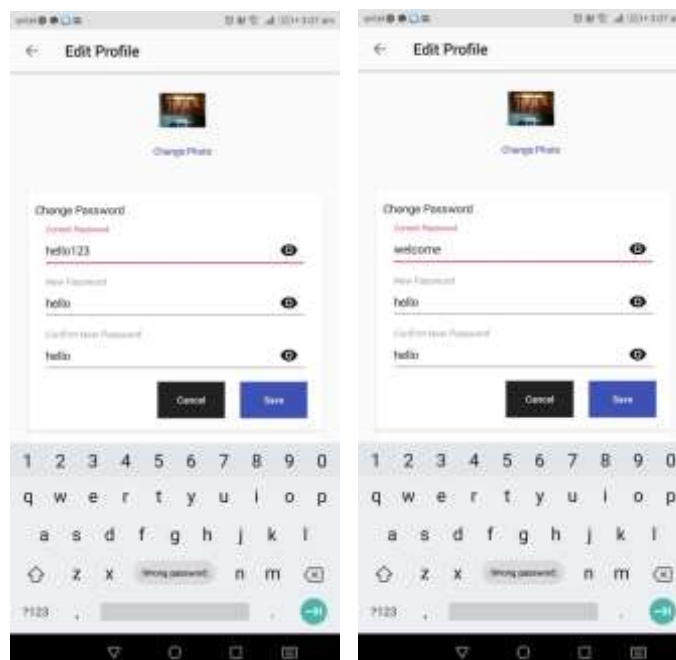

- Allows user to select photo from gallery but does not crop it for the actual icon
- Photo is changed in the edit page but never actually changed in the profile screen

The attempted photo change can be seen in the pictures ahead. In this the image orientation can be seen as well as the inability to be cropped into the icon size.

2. Change Password

- Allows user to change password once but never again
- Password change is not accepted and when user attempts to change password again, the app does not accept the new password with the “wrong password” overlay popping up every time
- Once the show password icon is clicked, the password never reverts to its hidden state even if the user shows other passwords or opens a new section and returns to the password section
- There is no option for if the user actually forgets the password
- If the user attempts to use the stored google password, the first click results in the section closing

The photos below show the multiple attempts to change the password for the second time and how the password never reverted to its hidden state. Correct password was at first hello123 and then changed to welcome after which the wrong password was indicated every time

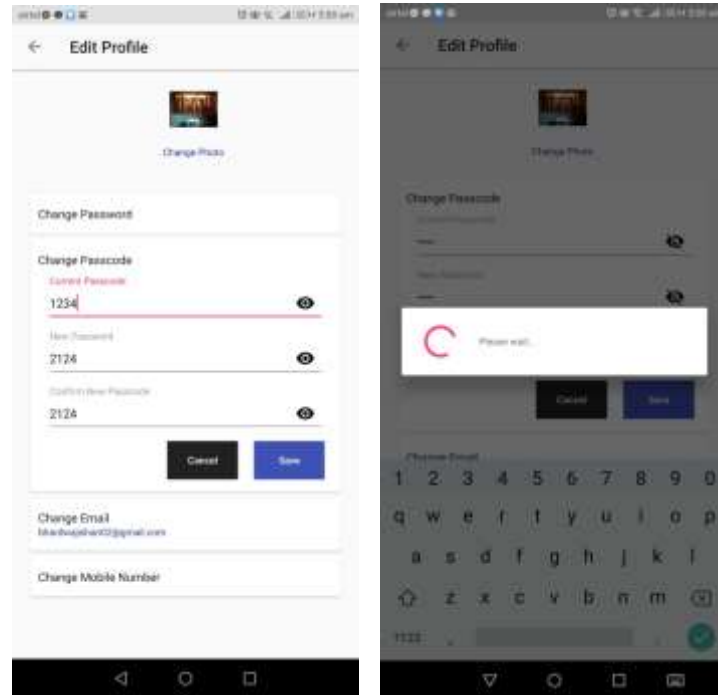

3. Change Pin

- Pin can never be changed; it gets stuck in the spinning wheel forever
- The pin never actually changes internally either

- c. Once the show pin icon is clicked, the pin never reverts to its hidden state even if the user shows other pins or opens a new section and returns to the pin section
- d. The keyboard in the change pin section has letters as well as numbers which is not needed and could bug the system

The images below show the inability of the pin to become hidden and the constant wait as well as the incorrect keyboard

4. Change mobile number
 - a. The mobile number first appears with an extra 91 in front of it
 - b. The mobile number cannot be changed and when this is prompted, an overlay pops up saying that the “parameter mobileNo is not supported”
